For lead-acid batteries, the recommended charging voltage is typically around 2.3 volts per cell or about 41.4 volts for a fully charged 36V battery pack. It's important not to overcharge these batteries as it can cause damage and reduce their lifespan.

Regardless of their capacity, 36V LiFePO4 batteries offer several key advantages over traditional lead-acid or other types of lithium-ion batteries: Longer Cycle Life: These batteries typically last for 2,000 to 5,000 charge cycles, far exceeding the lifespan of lead-acid batteries, which often need replacement after 300 to 500 cycles.
