The goal of this critical review is to explain why the safety problem raised by the lithium batteries must be considered. The performance of the batteries with different chemistries is compared and analyzed, with emphasis on the safety aspects, in addition to the electrochemical properties of the cells. Problems encountered with cathode materials (layered compounds, ...

This results in a more robust, thinner and safer battery. Enhanced safety is achieved through a minimal amount of liquid or gel electrolyte being used to reduce the flammable material in the battery. Early re-chargeable batteries contained lithium based electrodes, but in the 1980s it was discovered that re-charging resulted in changes to the electrodes that reduced thermal ...
