A lithium-ion battery is a type of rechargeable battery. It has four key parts: 1 The cathode (the positive side), typically a combination of nickel, manganese, and cobalt oxides; 2 The anode (the negative side), commonly made out of graphite, the same material found in many pencils; 3 A separator that prevents contact between the anode and cathode; 4 A chemical solution known ...

Graphite has remained the most widely utilized anode material since its debut in the first commercial lithium-ion battery (LIB) with a graphite anode back in 1994. This is attributed to its cost-effectiveness, widespread availability, and ability to operate at a low voltage (around 0.1 V compared to the Li/Li + reference). In the procedure of ...

Look closely at the cylinder-shaped battery in the picture. It has two ends: one has a part that sticks out on its top. Next to it, you can see a little plus (+) sign. This is the positive end of the battery, or cathode. The completely flat end of the battery has a minus (-) sign next to it. This is the negative end of a battery, or anode.
