Delaminations are a typical phenomenon, as are localized foreign particles such as residues resulting from the cutting process and from welding during battery assembly. Foreign particles pose a risk of short-circuiting. Exterior and interior CT-generated cut-away view of a battery prior to defect and structural analyses. (Volume Graphics)

The key is whether we feel comfortable with the probability of failure. Let us make a simple calculation. Assume that the self-induced failure rate at the vehicle level is calculated by  $p = 1 - (1 - P)^m$ , where  $P$  is the failure rate for  $m$  electric vehicles, each of which has a battery pack containing  $n$  cells. 1 Taking the Tesla Model S as an example,  $n = \dots$
