The battery explosion-proof valve of new energy vehicle battery rupture discs is a safety device that controls the pressure inside the battery. When the battery's internal pressure exceeds a certain value, the explosion-proof valve will explode and release the pressure to prevent the battery from exploding.

BATTERY-SPECIFIC EXPLOSION HAZARDS Large lithium ion battery systems such as BESSs and electric vehicles (EVs) pose unique fire and explosion hazards. When a lithium ion battery experiences thermal runaway failure, a series of self-rein-forcing chemical reactions inside the lithium ion cell produce heat

Using the wrong size battery can overheat it. This can lead to an explosion. Connecting a battery's terminals with a metal object outside can cause it to explode. A battery might internally short circuit due to damage. This can also cause an explosion. If a battery's vent holes are blocked, the gases inside can't escape.

In order to explain the engineering principles on which it is based the safety of Miretti explosion protected Li-Ion Batteries, Miretti would like to elaborate the following comments. In a Li-Ion battery, the internal cells might generate a dangerous explosion if they are present simultaneously the explosive material, a certain kind

of rugged battery [...]

A slight elevation on one side of the battery cell"s blue film seam is permissible, provided that the uplift does not extend to the front face of the cell.
