This is what people mean when they say you wire batteries in parallel by connecting positive to positive and negative to negative. In this example, I wired two 12V 100Ah batteries in parallel to get a 12V 200Ah battery bank. Because parallel connections don't affect voltage, there's no way to use a multimeter to check the connection.

Combining batteries in parallel adds up their capabilities. Three 1000mAh batteries in similar offer a full capacity of 3000mAh. Current: Series Connection: Current remains constant across all batteries in the series--the same current flows through each battery.
