The electrode materials are carefully chosen to optimize the battery's performance, capacity, and lifespan. Common materials used for the positive electrode include lithium cobalt oxide (LiCoO2) and nickel manganese cobalt oxide (NMC). For the negative electrode, materials like graphite and lithium titanate (Li4Ti5O12) are commonly used.

Electrons are simultaneously extracted from one electrode and injected into another electrode, storing and delivering electrical energy, during which materials are oxidized or reduced in positive and negative electrodes. Lithium ions shuttle between positive and negative electrodes, named lithium-ion (shuttlecock, swing, etc.) batteries.
