When the current used in the EC reduction potential regime ( $\sim 1.2 \text{ V}-0.5 \text{ V}$ ) is large and the subsequent lithiation current ( $\sim 0.5 \text{ V}-0.01 \text{ V}$ ) is small (i.e., two-step formation), both the first-cycle irreversible capacity loss and the formation time are decreased, with no impact on lifetime (as quantified by the Coulombic efficiency of subsequent cycles). In fact, the amount ...

For comparison, Foreship developed a separate analysis of the same ship using battery power in sensitive areas, shown in table 2. In this case, weekly energy consumption is 147.4 mWh from onboard production, including a 2.5 per cent saving from peak-load shaving and 5.7 mWh from electrical shore power. Weekly onboard energy consumption ...
