The Promise of the First-Gen Blade Battery. The original Blade Battery was a game-changer for the EV industry. Leveraging LFP chemistry, it provided a safer alternative to traditional lithium-ion batteries, which have been prone to thermal runaway--a phenomenon where a battery cell overheats and can potentially catch fire.

The strongest part of this platform is the super-safe and cheap battery made with long prismatic LFP (LiFePO4) cells - that are cobalt-free. The BYD Blade battery is already at 55 euros per kWh and with its TMS (Thermal Management System) works great even at low temperatures - as you can see in the chart above.

For thermal management, the Blade pack uses a cooling plate mounted over the cells, through which the coolant flows to manage cell temperatures.

It also features the industry's first direct cooling and heating system for power batteries, which increases the thermal efficiency by up to 20% in the winter. The innovative system leverages the residual heat from ...
