5.3 Reforming. Groups of electrolytic capacitors should be reformed in accordance with figure 1. 5.3.1 Capacitor reforming groups. The tungsten filament lamp in series with the capacitor bank will serve as a limiting resistor, which allows the voltage across the capacitors to rise as the leakage current decreases.

Capacitor banks reduce the reliability of the system because the failure rate of the bank is the failure rate of one capacitor multiplied by the number of capacitors in the bank. For this reason, capacitor banks are discouraged in high-reliability designs in favor of one large capacitor. High-reliability, high-density capacitors. For space ...
