Typical capacitor values are in the mF (10-3 F) to pF (10-12 F) The energy stored in a capacitor is  $2 \ 1 \ 2 \ E = Cv$  Large capacitors should always be stored with shorted leads. Example: A 47µF capacitor is connected to a voltage which varies in time as vt() =20sin(200pt) volts. Calculate the current i(t) through the capacitor C The current ...

Introduction to Capacitors. These types and sizes are based on their voltage level and value of capacitance. The first capacitor was invented by Pieter van Musschenbroek in 1746, who was a professor in Holland at the University of Leyden (or Leiden). At that time, the name of the invented capacitor was Leyden Jar, which was made with the help ...
