Capacitors are available in a wide range of capacitance values, from just a few picofarads to well in excess of a farad, a range of over 10^{12} . Unlike resistors, whose physical size relates to their power rating and not their resistance value, the physical size of a capacitor is related to both its capacitance and its voltage rating (a consequence of Equation ref{8.4}. Modest ...

The conventional failure criterion of MFC is that the capacitor loss reaches 5 % of the initial value [1], [12]. However, it can be seen from Fig. 2 that there is an unusual increase in ESR of No.1 and No.9 capacitors between 445 h and 725 h, which is also one of the characteristics of capacitor sudden failure. But their capacitance loss is still less than 5 %, ...
