(b) $Q = C \text{ eq } V$. Substituting the values, we get. $Q = 2 \text{ mF} \cdot 18 \text{ V} = 36 \text{ mC}$. $V_1 = Q/C_1 = 36 \text{ mC} / 6 \text{ mF} = 6 \text{ V}$. $V_2 = Q/C_2 = 36 \text{ mC} / 3 \text{ mF} = 12 \text{ V}$ (c) When capacitors are connected in series, the magnitude of charge Q on each capacitor is the same. The charge on each capacitor will equal the charge supplied by the battery. Thus, each capacitor will have a charge of 36 mC .

The Mechanically Commutated Series Capacitors (MCSC), also called Fixed Series Compensation (FSC) is the most common series compensation equipment currently installed in power systems [31,32]. The MCSC scheme is shown in Figure 5 . The capacitor banks consist of parallel and series arrays of AC capacitors, along with other auxiliary equipment.

1. Series Capacitors. Series capacitors, that is, capacitors connected in series with lines, have been used to a very limited extent on distribution circuits due to being a more specialized type of apparatus with a limited range of application. Also, because of the special problems associated with each application, there is a requirement for a large amount of ...

Series compensation also improves the voltage profile along the power corridor and optimizes power sharing between parallel circuits. Series compensation technology Because series capacitors are installed in series on a transmission line, the equipment must be elevated on a platform at system voltage, fully insulated from ground .

Capacitors can be arranged in two simple and common types of connections, known as series and parallel, for which we can easily calculate the total capacitance. These two basic ...

So, the total capacitance of capacitors connected in parallel is equal to the sum of their values. How to Calculate Capacitors in Series. When capacitors are connected in series, on the other hand, the total capacitance is less than the sum of the capacitor values. In fact, it's equal to less than any single capacitor value in the circuit.

To mitigate these issues, capacitors can be arranged in series or parallel combinations, resulting in four topologies: Series-Series (SS), Series-Parallel (SP), Parallel-Series (PS), and Parallel ...

The first configuration for a series capacitor modulated by anti-parallel GTO thyristors was proposed by Karady et al. . Then, Watanabe et al. suggested that any other high current rating switches, such as integrated gate commutated thyristor, can be utilised for the modulation of the series compensation capacitor (Fig. 2).
