U indicates the total energy density, which has a unit of J/cm^3 . Q_{max} , V , d , and A are the free charges in the electrode, the applied voltage, the distance between parallel plates of the capacitors, and the area of the electrode, respectively. E and D represent the applied electric field strength and electrical displacement, respectively, in the dielectric layer.

Suppose I take an uncharged capacitor and connect it across a power supply that delivers a constant current I . The voltage across the capacitor starts at zero and rises linearly until the component is fully charged. Then it stops. Call this maximum voltage V . The average voltage across the capacitor whilst it's being charged is $(V/2)$, so the average power being delivered to ...
