Time Electronics decade boxes are an established range of products with over 50 years of manufacturing history and quality behind them. They are passive devices that utilise a series of internal resistors, capacitors, or inductors to replicate specific electrical values in an application.

For the 100 mO and 1 O ranges I used power resistors with higher tolerances to be able to use my decade resistance box as load. The VITROHM resistors have tolerances of 5% and a maximum power dissipation of 2 W with a temperature coefficient of 1000 ppm/K. The switches I used are LORLIN 12-pole rotary switches with print contacts. They are specified with ...
