

The development of self-supporting electrodes, which are binder-, and additives-free, is essential for increased performance and practical applications of lithium-ion batteries (LIBs). With this aim, we report here the synthesis of carbon nanofiber (CNF) composites containing silica (SiO2) nanoparticles via Supersonic Solution Blowing ...

Since the carbon nanospheres have high specific surface, excellent chemical stability and thermal stability, etc., they can be applied to preparation of high strength and high density C/C composite materials, high performance liquid chromatographic columns, high specific surface area activated carbon materials, LIB ...

Preparation of electrode and battery assembly Preparation of the electrode. The Si/C or Si/C-Gr composite material as active electrode material, carbon black as conductive agent and sodium alginate as binder were mixed and dispersed in deionized water at a mass ratio of 7:2:1 to prepare a homogenous slurry.

Preparation of silicon carbon composite materials: 0.5 g SNT powder and 0.064 g bitumen were dissolved in tetrahydrofuran solution, and the mixed solution was stirred at a uniform speed under 60 °C constant temperature water bath conditions until the tetrahydrofuran was completely volatilized to obtain asphalt-coated SNT.

Moreover, losses of the nano-active materials from aqueous solutions is a major limitation for practical applications [83, 84]. Carbon aerogels have recently attracted attention as a way to circumvent these problems [85, 86]. Their large specific surface areas and macroscopic morphologies enable the uniform immobilization of active materials on ...

Finally, the future research opportunities for carbon materials and their potential applications are prospected from the aspects of the gap between theoretical prediction and preparation, the ...

Carbon-based materials are promising anode materials for Li-ion batteries owing to their structural and thermal stability, natural abundance, and environmental friendliness, and their flexibility in ...

In today's era, there are numerous problems with energy depletion, therefore how to efficiently convert and store energy is a big challenge. Carbon is widely used in electrode materials because its good tailorability, inexpensiveness and versatility. Melamine formaldehyde resin (MF) containing large amounts of nitrogen (N) and amino ...

The potential for recycling graphitic carbon from lithium-ion battery (LIB) anodes has been overlooked due to its relatively low economic value in applications. This study proposed to use graphene nanoplates (GNPs), which were obtained from spent lithium battery anode graphite, treated with ball-milling method, for hydrothermal ...

Nitrogen-doped carbon materials are reviewed by focusing on their preparation and applications. Their preparation is described in the order of graphene, carbon nanotube and fibers, porous carbons and carbon blacks, because the investigations working on graphene have taught us many fundamental information on N-doping, though ...

ABSTRACT. This paper studied the preparation method of graphene carbon nanotube supercapacitor electrode material for new energy vehicles. By analyzing the characteristics of electrode materials graphene and carbon nanotubes, combined with the working principle of supercapacitors, we designed an effective preparation process ...

Carbon materials synthesized from tributyl borate (TBB) using a nonthermal solution plasma method were characterized using x-ray diffraction, Raman, field emission scanning electron microscopy ...

1. Introduction. As the most powerful reducing element, lithium metal associated with strong oxydants (V 2 O 5, MnO 2, LiNiO 2, LiCoO 2,) leads to high voltage and high energy batteries that gained a deep interest from applications requiring higher and higher energy density for power sources. However, the well-known problem of dendritic ...

In a typical synthesis, a stoichiometric amount of material containing salt of Li:Fe:P was taken and dissolved in ethanol and stirred for 2 h without heat treatment and later temperature was set to 70 °C for half an hour [62].Pieces of silk cocoon were added and stirred for 2 h at 70 °C [63].The gel like precursor formed was taken in the Teflon ...

Though great progress has been made, nitrogen-doped carbon materials still need investigation in the development of low cost, simple, environment friendly preparation routes.

formation of carbon materials. Metal nanoparticle catalysts or heteroatom-doped carbon can be either prepared in situ or through post-treatment.32) Recently, plasma in liquid method has been accepted as a capable synthesis route for carbon-based materials including carbon nanotubes (CNTs),33) nano-onions,34) metal nanoparticles supported ...

Silicon-carbon anodes have demonstrated great potential as an anode material for lithium-ion batteries because they have perfectly improved the problems that existed in silicon anodes, ...

Preparation: Choosing an appropriate preparation method is a key to realizing high-behavior batteries. Besides, exploring new methods to extract BDC materials with unique structures from the ecosystem to ...

Low-cost, scale-up preparation of carbon-based materials remains one of the key factors for large-scale applications. Pure graphene-based porous materials can ...

Synthesis of materials. KB and BP2000 were received from Akzo Nobel N.V. and Carbot, respectively. OMCN was prepared as previously reported (Fang et al. 2010) a typical synthesis process, 0.6 g phenol, 2.1 ml formalin aqueous solution (37 wt%), and 15 ml (0.1 M) NaOH aqueous solution were mixed and stirred at 70 °C for 0.5 ...

A simple solution to meet the above requirement is to migrate carbon materials from electrode to the electrolytes or interlayers between Li and separators, which extends the roles of carbon materials as potential electrolyte additives or coating layers. ... more and more carbon-based battery materials can be designed and fabricated to ...

The high conductivity and porous structure of carbon materials help reduce cathode impedance and trap dissolved iodine species [8]. Our previous study has shown that porous active graphene is effective to improve the reversible capacity of a high-content iodine cathode [25]. However, trapping of iodine by using porous carbons mainly relies on ...

There is also a risk that battery production will stall because there isn"t enough recycled material available. Battery reuse is one potential solution that more countries should be considering ...

Among these electrochemical energy storage devices, LIBs and LICs are widely concerned [10], [11], [12], [13].LIBs are widely used in reality due to high energy density, safety and low environmental pollution [14], [15].At the same time, LICs with high energy density, fast charging/discharging performance, and high power density have also ...

However, there are still active investigations to identify the key parameters of carbons that provide the improved battery performance, as carbon-based materials have large varieties in the microstructure, texture, crystallinity, and morphology, depending on their preparation processes and precursor materials, as well as various forms such ...

Sodium-ion batteries (SIBs) have been proposed as a potential substitute for commercial lithium-ion batteries due to their excellent storage performance and cost-effectiveness. However, due to the substantial radius of sodium ions, there is an urgent need to develop anode materials with exemplary electrochemical characteristics, thereby ...

Recent progress in cobalt-based carbon materials as oxygen electrocatalysts for zinc-air battery applications. ... In an alkaline electrolyte solution: (1) ... In general, Brunauer-Emmett-Teller (BET) adsorption isotherm is a common method to study the surface area of materials. The specific surface area is usually determined ...

1. Introduction. The global transition towards sustainable energy practices necessitates innovative solutions to address challenges associated with the intermittency of clean energy sources [1, 2]. As solar and wind energy

become integral components of the energy mix, the need for efficient energy storage systems grows [[3], [4], [5], [6]].Battery ...

Compared with fossil fuel-based carbon precursors, biomass as the precursor for the preparation of carbon materials has the advantages of low cost, sustainable supply, extensive availability, and easy accessibility. It is noteworthy that biomass waste is the most valuable carbon source among all biomass sources considering its environmental ...

2.1.1. Graphite. Recognized for its glossy black glimmer, graphite, a known carbon allotrope, is experimentally proven to have a high flexibility but also has a hard and stiff feature [37]. Another property that graphite is known for is its unique metal and non-metal attribute [38]. Graphite is also recognized for its high thermal and electrical conductivity, ...

Carbon materials are lightweight, which can retain the high-energy-density feature of LMBs. (3) Carbon materials have various forms, such as graphite, graphene, reduced graphene oxide (rGO), and carbon nanotubes (CNTs), with different physicochemical properties, providing numerous possibilities for stabilizing Li metal ...
