In the case of valve regulated lead-acid (VRLA) batteries, widely used in HEV applications, since the open-circuit terminal voltage of a VRLA battery varies almost linearly over the majority of the battery's SoC (Fig. 2) [2], [20], we can employ this characteristic to estimate SoC in VRLA batteries. ...

The reason is that lead-acid batteries normally form bubbles on the plates during charging. And these get big enough and then rise. Some chargers will periodically reverse the charging voltage polarity for a moment in order to force the bubbles loose so as to keep them small, as the bubbles interfere with re-plating lead from solution back onto the plates, forming unwanted filaments of ...
