Redox flow batteries can be divided into three main groups: (a) all liquid phases, for example, all vanadium electrolytes (electrochemical species are presented in the electrolyte (Roznyatovskaya et al. 2019); (b) all solid phases RFBs, for example, soluble lead acid flow battery (Wills et al. 2010), where energy is stored within the electrodes.

Energy storage is increasingly seen as a valuable asset for electricity grids composed of high fractions of intermittent sources, such as wind power or, in developing economies, unreliable generation and transmission services. However, the potential of batteries to meet the stringent cost and durability requ
