DC-AC coupled energy storage

On the flip side, AC-coupled battery systems are less efficient because the direct current from the solar panels must be inverted twice -- from DC to AC, then back to DC -- before actually going into the battery for storage, and a little bit of energy is lost each time the current is inverted.

There are two different approaches when it comes to coupling solar panels and a battery storage system. The connection between the solar panels and the energy storage system can use either alternating current (AC) or direct current (DC)--two types of voltage which transmit and conduct electricity. With AC, the electricity flows back ...

Since solar panels produce DC, and batteries store DC energy, it makes sense that the battery storage system also works on DC electricity. In an AC-coupled system, the energy generated from the solar panels is converted to AC, converted again to DC to store in the battery, and when in use in the home, converted back to AC.
