New battery technology aims to provide cheaper and more sustainable alternatives to lithium-ion battery technology. New battery technologies are pushing the limits on performance by increasing energy density (more power in a smaller size), providing faster charging, and longer battery life. What is the future of battery technology?

Now the MIT spinout 24M Technologies has simplified lithium-ion battery production with a new design that requires fewer materials and fewer steps to manufacture each cell. The company says the design, which it calls "SemiSolid" for its use of gooey electrodes, reduces production costs by up to 40 percent.

The four major components of the LIB are the cathode, anode, electrolyte, and separator. LIBs generally produce an average cell voltage of around 3.7 V and operate on the relatively simple principle of reversible intercalation of Li ions in the cathode and anode. The most commonly used material for the cathode is lithium
