The development comes at a critical time as the demand for lithium in electric vehicles and renewable energy storage continues to grow. Adionics" technology offers a solution to the growing challenge of battery recycling, providing a domestic alternative to overseas processing and reducing reliance on new lithium mines.

Many people see affordable storage as the missing link between intermittent renewable power, such as solar and wind, and 24/7 reliability. Utilities are intrigued by the potential for storage to meet other needs such as relieving congestion and smoothing out the variations in power that occur independent of renewable-energy generation.

primarily on plug-in electric vehicles, energy load profiles might shift, creating additional energy demand during work hours and a greater overnight demand once residents return home. New energy producers at the distribution level (e.g., customer-generated power with energy storage) may challenge local markets.
