The first step on the road to today's Li-ion battery was the discovery of a new class of cathode materials, layered transition-metal oxides, such as  $\text{Li}_x\text{CoO}_2$ , reported in 1980 by Goodenough and collaborators. These layered materials intercalate Li at voltages in excess of 4 V, delivering higher voltage and energy density than  $\text{TiS}_2$ . This higher energy density, ...

**Why Does Battery Voltage Drop Under Load** . Batteries are like people in that they get tired as they work. The chemical energy in the battery is converted to electrical energy, and this process is not 100% efficient. That's why batteries get hot when you use them for a long time - some of the energy is being lost as heat.
