Our plug-and-play solutions can be added to the existing architecture, connecting directly to the DC link. This enables EV fast charging operators to avoid investing in a new medium voltage connection and low voltage distribution grid upgrades, providing very high return on investment in Teraloop's energy storage solution.

In this calculation, the energy storage system should have a capacity between 500 kWh to 2.5 MWh and a peak power capability up to 2 MW. Having defined the critical components of the charging station--the sources, the loads, the energy buffer--an analysis must be done for the four power conversion systems that create the energy paths in the station.

2.1 Electric vehicle charging network. A charging station usually contains multiple charging piles. When an EV is connected to the charging pile for charging, the real-time load is integrated by the charging aggregator, and the power is transmitted to each charging pile interface to charge the EVs.

A charging pile, also known as a charging station or electric vehicle charging station, is a dedicated infrastructure that provides electrical energy for recharging electric vehicles (EVs) is similar to a traditional gas station, but instead of fueling internal combustion engines, it supplies electricity to recharge the batteries of electric vehicles.
