2. Considering the optimization strategy for charging and discharging of energy storage charging piles in a residential community. In the charging and discharging process of the charging piles in the community, due to the inability to precisely control the charging time periods for users and charging piles, this paper divides a day into 48 time slots, with the control system ...

The capacity of energy storage charging piles accounts for the largest proportion in the capacity planning results, followed by PV units and wind turbine units.

A charging station contains multiple charging piles. When the EV arrives at the charging station, it enters the queue to wait first. When a charging pile is idle, the EV at the front of the queue goes to the charging pile to charge. The EV queueing model at the charging station is shown in Figure 9. For the EV that needs to be charged on the ...

The ability of DC charging piles to support V2G systems is a game-changer for both EV owners and utility companies. It allows EVs to serve as mobile energy storage units, contributing surplus electricity generated by renewable sources such as solar panels or wind turbines back into the grid when there's a high demand for power.

Because of the popularity of electric vehicles, large-scale charging piles are connected to the distribution network, so it is necessary to build an online platform for monitoring charging pile operation safety. In this paper, an online platform for monitoring charging pile operation safety was constructed from three aspects: hardware, database, and software ...

Under net-zero objectives, the development of electric vehicle (EV) charging infrastructure on a densely populated island can be achieved by repurposing existing facilities, such as rooftops of wholesale stores and parking areas, into charging stations to accelerate transport electrification. For facility owners, this
