As another means of regulating the charging load, time of use (TOU) pricing that is originated from demand-side management can effectively guide the charging behavior of users by adjusting the price of electricity in different periods of time. Silva et al. (2015) propose a task scheduling method based on an ant colony algorithm to reduce the peak load and user cost.

Assuming there are T charging piles in the charging station, the power of single charging pile is p , the number of grid charging pile is S , and the number of storage charging pile is R . For this reason, the maximum power provided by the grid to the charging station is quantified as S , which means S EVs can be charged at the same time.
