Not only are lithium-ion batteries widely used for consumer electronics and electric vehicles, but they also account for over 80% of the more than 190 gigawatt-hours (GWh) of battery energy storage deployed globally through 2023. However, energy storage for a 100% renewable grid brings in many new challenges that cannot be met by existing battery technologies alone.

The overview of battery storage for solar energy is quite simple. Solar panels generate direct current (DC) electricity, which is then converted to alternating current (AC) using an inverter. The AC electricity can be used to power your home or business, and any excess energy is sent to the battery storage system for later use.
