

Experimental setup for verifying capacitors

3. Devise (and perform) an experimental procedure to verify that a parallel plate capacitor filled with two different dielectrics (nylon and vinyl) placed in parallel, side by side (see Fig. 4), behaves as two separate capacitors in series. Record some values of the capacitance. Remember to measure the thickness of the nylon and vinyl sheets.

The Details: Capacitors. Capacitors store charge, and develop a voltage drop V across them proportional to the amount of charge Q that they have stored: $V = Q/C$. The constant of ...

Recently, a phenomenon of zero-reflection from a time-varying reactive element, that operates as an energy accumulation component, has been predicted theoretically. Possible experimental verification of zero-reflection phenomenon is rather challenging, due to a high dynamic range of required reactance values. Here, we propose a simple experiment based on ...
