capacitors with improved performance at high temperature: capacitors performing reliably above 100 - 150 °C would aid the thermal management in applications with space and weight limitations, such as in electrical vehicles [1]. Film capacitor performance is governed by the dielectric film and metallization end connections.

The constant, 8.85 × 10 -12, is the dielectric constant of vacuum, which can be denoted as e 0 (F/m). e r is the relative dielectric constant without dimensions. A is the area where the electrode overlaps with the dielectric (m 2).. This paper will use Equation to calculate the corresponding capacitance of a film capacitor based on the dielectric constant of films.
