

# Fluorescent solar cell

2.1 UV-fluorescence Imaging. UVF imaging is an established inspection tool for PV modules, especially when a rapid, non-destructive on-site characterization method for aging effects in encapsulants [10-12, 17, 25-27] and/or cell-breakage-detection is needed [28- 32] general, the polymeric encapsulant (polymer + additives) of PV modules does not show ...

We propose a new concept exploiting thermally activated delayed fluorescence (TADF) molecules as photosensitizers, storage units and signal transducers to harness solar thermal energy. Molecular ...

Thin film and sheet PbS quantum dots (QDs) concentrators were synthesized by sol-gel method using three different PbS concentrations (0.14, 0.2, and 0.4 mol %). The structure and morphology of the prepared PbS QDs were characterized by X-ray diffraction (XRD), Scan electron microscopy (SEM), and Transmission electron microscopy (TEM). The photostability ...

Fluorescent concentrators offer the possibility to separate different portions of the solar spectrum just like multijunction cells and concentrate them at the same time [] gure 12.2a shows a stack of three concentrators  $c_1$  - $c_3$  contacted by three different solar cells  $S_1$  - $S_3$ . The ideal absorption and emission spectra of the fluorescent molecules in the collectors ...

1. Introduction. As a promising photovoltaic technology, organic solar cells (OSCs) have attracted substantial attention for their superiorities of low cost, light weight, solution processing and potentially flexible application prospects [1], [2], [3]. Profiting from the numerous efforts devoted to materials design and device engineering, the power conversion efficiency ...

Nearly all types of solar photovoltaic cells and technologies have developed dramatically, especially in the past 5 years. Here, we critically compare the different types of photovoltaic ...

A luminescent solar concentrator (LSC) is a transparent piece of plastic or glass that has a fluorescent dye or quantum dots embedded or painted on it. ... a glow that propagates by total internal reflection to the edge of the sheet where the light is absorbed by a narrow solar cell. This is a promising technology because it allows a large ...

Recently, one of the authors [2], [3] has shown that coatings of yellow and pink fluorescent coloring agent (FCA) on the solar cell give 17-27% increase in the energy conversion efficiency of the solar cell. The increase is attributable to the reduction of the reflection of the incident light at the surface of FCA. In particular, the reflectivities showed low ...

of the DSSCs solar cells was 4.28% with fluorescent photonic crystal (FPC) films as back reflector, which was improved by 4.9%. The  $J_{sc}$  was increased from 7.64 to 8.0 mA/cm<sup>2</sup>.

In addition, the technology of LSC can also be employed as spectral converter, shifting wavelengths of the solar spectrum to different ones that better match the regions of better efficiencies of solar cells. However, light reabsorption and fluorescence quenching phenomena limit the PV performances in LSC. To tackle this problem, much ...

1 Introduction. Biogenic materials/compounds, such as photosynthetic light-harvesting systems, DNA, polysaccharides, and fluorescent and/or redox proteins, have always drawn the attention as a paradigm of sustainable energy materials in solar cells to meet eco-efficiency and device performance expectations.

Here, we report organic single-junction solar cells that selectively harvest near-ultraviolet photons, produce open-circuit voltages eclipsing 1.6 V and exhibit scalability in power generation ...

Carbon quantum dots (CQDs) are emerging as promising materials for applications like flexible or transparent solar cell, white light emitting diodes (WLEDs), etc. due to their low cost, eco ...

Ruthenium-based metal complex dyes have been employed extensively in dye-sensitized solar cells (DSSCs) as photosensitizers, but the cost and toxicity of metal complexes have promoted the development of metal-free organic dyes. ... All dyes were highly fluorescent and exhibited fluorescence in the visible region spanning over 575-685 nm. DCI ...

This paper reports the external quantum efficiency (EQE) of encapsulated screen-printed crystalline silicon solar cells, where the encapsulation includes a layer of luminescent down-shifting (LDS) molecules. At wavelengths less than 400 nm, the inclusion of the LDS molecules increases the EQE from near zero to, at most, 40%. ...

LSCs are optoelectronic devices based on a sun irradiation collector made of fluorophores that, after the solar radiation absorption, re-emit visible light propagating via a ...

These advantages have led to the emergence of a variety of novel perovskite-based devices in the past decade 5,6, such as solar cells (SCs) 7,8,9,10, light-emitting diodes (LEDs) 11,12,13,14 ...

DOI: 10.1016/0165-1633(79)90027-3 Corpus ID: 98525234; The effect of fluorescent wavelength shifting on solar cell spectral response @article{Hvel1979TheEO, title={The effect of fluorescent wavelength shifting on solar cell spectral response}, author={Heinz H{&quot;o}vel and Rodney Trevor Hodgson and Jerry M. Woodall}, journal={Solar Energy Materials}, year={1979}, volume={2}, ...

Selenium (Se) solar cells were the world's first solid-state photovoltaics reported in 1883, opening the modern photovoltaics. However, its wide bandgap (~1.9 eV) limits sunlight harvesting. ... (LEDs) and fluorescent lamps (FLs) thereby determine that the optimal bandgap of indoor light absorber materials is ~1.9 eV (7, 8). This hence leads ...

DOI: 10.1002/anie.202000199 Corpus ID: 210086073; Alkyl Chain Regulated Charge Transfer in Fluorescent Inorganic CsPbBr<sub>3</sub> Perovskite Solar Cells. @article{Duan2020AlkylCR, title={Alkyl Chain Regulated Charge Transfer in Fluorescent Inorganic CsPbBr<sub>3</sub> Perovskite Solar Cells.}, author={Jialong Duan and Yudi Wang and Xiya Yang and Qunwei Tang}, journal={Angewandte ...

Silicon quantum dots (Si QDs) with unique properties of light, electricity, magnetism, and heat possess the advantages of non-toxicity, environmental protection, and serving as abundant reserves. They are widely used in various fields and have great potential for development. Till now, numerous researchers have reported the research progress of Si QDs ...

In recent years, perovskite solar cells (PSCs) have received a lot of interest due to their outstanding power conversion efficiency (PCE) and inexpensive cost of manufacturing [1-4]. Unfortunately, they are generally susceptible to oxygen, moisture, heat, and ultraviolet (UV) light under atmospheric conditions and thus fail to achieve satisfactory operational stability [5-8].

Semantic Scholar extracted view of "Solar cell module colored with fluorescent plate" by T. Maruyama et al. Skip to search form Skip to main content Skip to account menu. Semantic Scholar's Logo. Search 222,012,569 papers from all fields of ...

Suppressing the charge recombination process and enhancing charge carrier transport are promising strategies to improve the photovoltaic performance of organic solar ...

The study shows that the emission wavelength ( $\lambda_{em}$ )-dependent photoluminescence decay lifetime ( $\tau_{em}$ ) determines the down-conversion efficiency of the nitrogen-functionalized graphene quantum dots (NGQDs) and significantly increased the maximum current output and thus enhanced the solar-cell performance.

For some solar cells, the future may be fluorescent. Scientists at Yale have improved the ability of a promising type of solar cell to absorb light and convert it into electrical ...
