Lithium metal batteries (LMBs) are such a candidate. However, the anode, lithium metal, is reactive with electrolyte and a passivation layer, called a solid-electrolyte interphase, forms on the surface of lithium metal during battery operation. Another issue of lithium metal anode is so-called "dendrite growth", appearing during battery ...

Accordingly, the development of battery recycling has surfaced as a highly researched topic in the battery community. Recently, the structural and electrochemical restoration of recycled electrode materials have been proposed as a non-destructive method to save more energy and chemical agents compared with mature metallurgical methods.

A major advantage of these batteries is their huge electrochemical benefits--a tremendous revolution in lithium battery technology. An accurate self-discharge rate is crucial for enhancing battery management system performance since it is impossible to determine the true state of charge (SOC) precisely after extended storage [28].

Each battery is a densely packed collection of hundreds, even thousands, of slightly mushy lithium-ion electrochemical cells, usually shaped like cylinders or pouches.
