An autonomous supply of electricity by means of rechargeable batteries would be ideal. The ESP8266 solar panel power supply is of course an obvious solution. During the day, the microcontroller is supplied with electricity from the solar cell and a battery is charged at the same time. This energy storage device is then used at night.

A simple system doesn't involve any re-wiring, and doesn't change any of the wiring to the rest of the house. The solar panels connect into your consumer unit as a new dedicated circuit.

7. Connect Your Battery and Inverter to Your Home. The solar panels and the battery generate direct current (DC) electricity. For solar energy to power your home, you need to run the system-generated electricity through the inverter and convert it into alternating current (AC).

In a blackout, a fully charged battery will supply you with power for longer periods. If you're building a solar home backup system to ensure an off-grid energy supply, you'll need to purchase solar panels and balance of system components. Make sure the solar panels and battery are compatible.
