The direction of current through the battery determines whether it is charging or discharging. The battery is trying to push current in a particular direction. If the current flows in that direction, the battery is discharging. If the current flows in the other direction, the battery is charging. It is a little bit like a spring or a clockwork toy.

To test the condition of a rechargeable battery, you will need the following tools: Multimeter - A multimeter

\$begingroup\$ Making a table with one full charging cycle on 1C starting current (on low SOC state, depending on battery type) for charge voltage (on battery or charger terminals is less important, if wire resistance is known and/or very low and maybe low 1digit A currents, but keep consistent through one cycle) and charge current on a (depending on ...

The battery is not charging if it's at a voltage higher than the charging input. For example when the battery is at 10V and the charger is at 9V, the battery is not charging. The battery is charging when the current is ...

Determining whether a 12V car battery needs charge is as easy as touching its leads to those of a multimeter. While charging from a vehicle's alternator, the multimeter method fails to determine the battery's state of charge and instead reports the alternator's 14V until the engine is turned off. Only then can we read the battery's voltage again.

The polarity of a battery refers to the electrical charge distribution within the battery. It indicates the battery's positive (+) and negative (-) terminals. The positive terminal is typically marked with a plus sign (+), while the negative terminal is marked with a minus sign (-) or a symbol indicating the negative polarity.
