# How to identify whether a lithium battery pack is good or bad

Whether I'm using a lead-acid battery to power a vehicle, a backup power system, or any other device, I need to be able to rely on it to work when I need it. By testing the battery's health, I can identify any issues that could affect its performance and take steps to address them before they become a problem.

The easier way how to find whether lithium battery is bad or not Try to charge it to full SoC (near 100%) and then measure voltage drop when discharge. Example: 18650 battery cells with rated capacity 2600mAh have nominal voltage 3.6V, full charge 4.2V and cut-off discharge limit 2.75V.

Compare the reading with the battery's nominal voltage. If the voltage is significantly lower than the nominal value, the battery may be nearing the end of its life. Method 3: Capacity Test. To perform a capacity test, charge the battery fully and then discharge it using a known load. Measure the time it takes for the battery to discharge ...
