Instead, the vehicle relies on its thermal management system to regulate the battery temperature during diverse driving conditions, including fast charging sessions. Challenges in Cold Weather. One notable consideration for ID.4 owners is the impact of cold weather on charging speeds. Although the ID.4 heats the battery during operation, the ...

Owing to small energy consumption and preheat current during preheating, this self-preheating system could still preheat the battery pack from  $-10\text{ }^{\circ}\text{C}$  to  $20\text{ }^{\circ}\text{C}$  even at 0.2 SOC. As shown in Fig. 5 (c), the battery pack was preheated from  $-10\text{ }^{\circ}\text{C}$  to  $20\text{ }^{\circ}\text{C}$  in 180 s, with an increase of the voltage of the battery pack from 14.7 V to 19 V.

Strategies for pre-heating the traction battery were hinted at on last night's podcast but I feel more confused than before. I'm posting this on the MG4 thread but I daresay strategies apply equally well to the ZS mk2 and 5 too. I'll throw a few bulleted points out there to aid discussion but would be grateful for info and advice as to best ...

can't pre-heat the battery without pre-heating the cabin. Not sure why you wouldn't want to pre-heat the cabin though. If there is no charger like you said, no point in wasting that energy in pre-heating the battery. That only helps with regen, and the effect on range is negligible. You're going to lose more potential range than getting back on ...
