If we do that, we will get the voltage drop across the internal resistance. $V_{\text{internal}} = 3.85 - 3.72 = 0.13\text{V}$. Now we have the voltage drop across the internal resistor, we can just divide it with the calculated current and we will get the internal resistance. $ISR = (V_{\text{drop-internal}} / \text{Current}) = 0.13 / 3.236 = 0.04017 \text{ ohms}$. The calculated internal ...
