The voltage produced by a single solar panel, known as the open-circuit voltage (Voc), typically ranges from 30 to 40 volts, depending on the panel's specifications and environmental conditions. However, to achieve the desired voltage output of 240 volts, multiple solar panels are connected in series, forming a solar array.

The same goes for solar panels, the actual operating voltage of a 12V solar panel might be 13V, 17V, or even 23V, all these volts will still be in the operating range of a 12V solar panel and will charge your 12V battery just fine. In short, the nominal voltage is simply used as an approximate voltage to help you match equipment more conveniently.
