Since 2009, perovskite solar cell efficiency has leaped from 3% to over 25%. This shows their promise for powering our future. By stacking perovskite materials, we can make tandem cells that go beyond previous limits. But, we need to make them last longer, easier to make, and prove their reliability in the real world before we see them ...

A perovskite solar cell is a type of solar cell which includes a perovskite structured compound, most commonly a hybrid organic-inorganic lead or tin halide-based material, as the light-harvesting active layer. Perovskite materials such as methylammonium lead halides are cheap to produce and relatively simple to manufacture.
