Batteries and similar devices accept, store, and release electricity on demand. Batteries use chemistry, in the form of chemical potential, to store energy, just like many other everyday energy sources. For example, logs and oxygen both store energy in their chemical bonds until burning converts some of that chemical energy to heat.

The battery discharges (gives up a little of its energy) to help the car's gasoline engine start up, and recharges (gets energy back again) when the engine begins generating electrical energy through a device called an alternator. As for disadvantages, lead-acid batteries are relatively big, surprisingly heavy (try lifting one!), expensive, and ...

Temperature is a critical aspect of lithium battery storage. These batteries are sensitive to extreme conditions, both hot and cold. The ideal temperature range for lithium battery storage is  $20^{\circ}\text{C}$  to  $25^{\circ}\text{C}$  ( $68^{\circ}\text{F}$  to  $77^{\circ}\text{F}$ ). This temperature range helps to maintain the battery's chemical stability and avoids rapid aging.
