It indicates that the voltage at the point of common coupling decreases below the minimum short-circuit ratio. A technique was suggested to improve the voltage stability by utilizing load curtailment and battery energy storage, ensuring that the voltage remains above the specified limit.

Also, the number of charging piles for most EVCSs is increased, which means that the wind power integration allows the system to serve more EVs and thus increase the charging service level of the system.

Similarly, EVBox and Heliox provide their customers with the option to choose the power level. Another important feature of these chargers is the output voltage range. Most of the state-of-the-art chargers are capable of supplying the 200-1000 V range. A limit for DC fast charging is the current limit imposed by the vehicle.
