The life of an aluminum electrolytic capacitor is primarily defined by the ambient temperature and self-heating due to the applied ripple current. To properly estimate life, an accurate measurement of the internal temperature is especially important for under hood and powertrain applications where high temperature and ripple are common.

Electrolytic capacitors are used in several applications ranging from ... (National Instruments) data acquisition system. A voltage source with a square wave of 200 mHz frequency and 1V output was used for generating the required signal. The output voltage from the source was then ramped up to the required voltage of 12V using an external

An aluminum electrolytic capacitor, usually simply called an electrolytic capacitor (e-cap), is a capacitor whose anode (+) consists of pure aluminum foil with an etched surface, covered with a uniformly very thin barrier layer of insulating aluminum oxide, which operates as a dielectric. The electrolyte, which covers the rough surface of the oxide layer, operates as the ...

Electrolytic capacitors, due to being constructed as a very long plate wound into a coil, have relatively high ESL (equivalent series inductance). So high in fact, that they are completely ineffective as capacitors above 100kHz, or 150kHz for polymer types. Above this frequency, they are basically just resistors that block DC.
