To have a better understanding of the heat sources and sinks in a lead-acid battery, the generated heat of different reactions and heat dissipation is plotted in Figure 10. As expected, according to Figure 10(a), the generated heat of main reactions is zero. The same argument is true for hydrogen reaction and it can be seen from Figure 10(b).

The battery is packed in a thick rubber or plastic case to prevent leakage of the corrosive sulfuric acid. The case also helps to protect the battery from damage. Working. When a lead-acid battery is charged, the lead sulfate on the plates is converted back into lead oxide and lead. This process is called "charging."
