Examine the medium-length line equivalent circuit in Fig. 2. Notice that the circuit has both a VAR source (the shunt capacitor) and a VAR sink (the series line impedance). The VARs produced by the line are determined by the sending-end voltage (VS) and the line susceptance (B). Because the line susceptance is fixed and the ...

Power Factor Correction is a technique which uses capacitors to reduce the reactive power component of an AC circuit in order to improve its efficiency and reduce current.. When dealing with direct current (DC) circuits, the power dissipated by the connected load is simply calculated as the product of the DC voltage times the DC ...

An EMTP-ATP model and a MATLAB model of 66kV double line network are built and simulated. By applying shunt capacitor compensation method for de-icing 66kV overhead transmission line within the models, the simulation results show an increase of the rms line current to 650A for the de-icing line which leads the cable temperature to increase. A ...

2. Back-to-back switching: Energizing the second bank C 2 when the first bank C 1 is already energized is called back- to-back switching [5], and is simulated by closing switch S2 when C 1 is already operating in steady state. The resulting inrush to C 2 is a high-frequency transient which primarily involves the series combination of C 1, LB, and C 2, driven by ...
