Batteries are perhaps the most prevalent and oldest forms of energy storage technology in human history. 4 Nonetheless, it was not until 1749 that the term "battery" was coined by Benjamin Franklin to describe several capacitors (known as Leyden jars, after the town in which it was discovered), connected in series. The term "battery" was presumably chosen ...

Lithium-ion battery is a kind of secondary battery (rechargeable battery), which mainly relies on the movement of lithium ions (Li⁺) between the positive and negative electrodes. During the charging and discharging process, Li⁺ is embedded and unembedded back and forth between the two electrodes. With the rapid popularity of electronic devices, the research on such ...

Lithium-air batteries have scope to compete with gasoline in terms of energy density. However, in most systems, the reaction pathways either involve one- or two-electron transfer, leading to lithium peroxide (Li₂O₂) or ...

Electric vehicle (EV) powered by the lithium ion battery (LIB) is one of the promising zero-emission transportation tools to address air pollution and energy crisis issues (). However, much longer recharging time of the EV than the gas-refilling time of traditional fuel vehicle makes it much less competitive () this scenario, building up extremely fast-charging ...

The high salinity of most inferior lithium brines creates a substantial osmotic potential between the brine and lithium extraction solution. This potential, ubiquitously observed upon the contact of seawater and river (fresh) water, is the origin of the so-called "blue energy," which is ranked as the second-largest marine-based energy source (1.4 to 2.6 TW) (18, 19) ...
