During the MOSFET on phase, the full power supply voltage is connected to the battery for a very brief period of less than 32 microseconds (given the PWM frequency of 31.25 kHz). Whereas the power supply voltage is divided between the battery, MOSFET, diode, the battery's internal resistance and the shunt resistor. Thus, the power resulting ...

So if you want to charge a Li-Ion battery with a XL4015 module, say at 2 amp rate, ... The input power specifications has to be higher than the output power, meaning the input supply wattage capacity must be higher than $5\text{ V} \times 5\text{ A} = 25\text{ W}$. Therefore, if an input supply of 36 V is used, then the input current should be higher than $25 / 36 = 0.7\text{ Amps}$. If 8 V is used ...
