Some researchers argue that such local defects could also cause dendrite growth through the separator and ISCs in lithium-ion batteries, analogous to lithium-metal batteries [24]. Additionally, breathing-induced repeated loading and unloading of the separator in high-pressure areas may result in fatigue.

Both the internal mechanical deformation caused by Li-dendrite growth and external mechanical load of LIBs are the main reasons for its ISC, which may further evolve ...

Lithium battery deformed by collision

Pioneering work of the lithium-ion battery began in the early 900s, but only after 1970s non-rechargeable lithium batteries became commercially available, using metallic lithium as anode material. At today, rechargeable Li-ion batteries uses graphite as anode, while a metal oxide is used as the cathode.
