Research on rechargeable Li-ion batteries dates to the 1960s; one of the earliest examples is a CuF₂/Li battery developed by NASA in 1965. The breakthrough that produced the earliest form of the modern Li-ion battery was made by British chemist M. Stanley Whittingham in 1974, who first used titanium disulfide (TiS₂) as a cathode material, which has a layered structure that can take in lithium ions without significant changes to its crystal structure. Exxon tried to commercialize this ba...

But a 2022 analysis by the McKinsey Battery Insights team projects that the entire lithium-ion (Li-ion) battery chain, from mining through recycling, could grow by over 30 percent annually from 2022 to 2030, when it would reach a value of more than \$400 billion and a market size of 4.7 TWh. 1 These estimates are based on recent data for Li-ion ...

However, lithium-ion batteries defy this conventional wisdom. According to data from the U.S. Department of Energy, lithium-ion batteries can deliver an energy density of around 150-200 Wh/kg, while weighing significantly less than nickel-cadmium or lead-acid batteries offering similar capacity. Take electric vehicles as an example.
