Lithium Cathode: The electronic gadget receives its power supply from the lithium cathode, which is also composed of lithium due to the element's high energy density and low rate of reactivity. Graphite Anode: The energy that is generated by the cathode is stored in the graphite anode, which is constructed out of easily available, low-cost graphite that has a ...

The pulsed current has been proposed to achieve fast charging and extend the lifetime of lithium-ion (Li-ion) batteries. However, the optimal condition of the pulsed current is still inconclusive in previous studies. This article experimentally investigated the effect of the low-frequency positive pulsed current (PPC) charging on the lifetime and charging performance of ...

1 Introduction. Lithium-ion batteries (LIBs) have long been considered as an efficient energy storage system on the basis of their energy density, power density, reliability, and stability, which have occupied an irreplaceable position in the study of many fields over the past decades. [] Lithium-ion batteries have been extensively applied in portable electronic devices and will ...
