Avoid use or storage of lithium-ion batteries in high-moisture environments, and avoid mechanical damage such as puncturing. A battery cell consists of a positive electrode (cathode), a negative electrode (anode) and an electrolyte that reacts with each electrode. Lithium-ion batteries inevitably degrade with time and use.

In this article, we report on the preparation of few-layered MoS 2 /graphene nanocomposite (MoS 2 /GNS-G) with enlarged interlayer distance as the lithium-ion battery anode via a facile hydrothermal method followed by glucose-assisted thermal annealing. During the synthesis, glucose serving as a small organic molecule can interlay into MoS 2 nanosheets, ...
