Supercaps are linear like all capacitors, but this curve looks like the curve of lithium-ion batteries. A major downside of supercaps is their much lower energy density, compared to batteries. Their upside is their endurance, they basically don't age like batteries and can take an enormous amount of cycles and very high (dis-)charge currents.

\$begingroup\$ thanks for the reply. In my application I have mentioned the maximum usage mostly the power will be less than that around 40W. Is there any chance I am able to use capacitors with higher voltage ratings eg:- 100mF caps with 16V ratings. since the voltage is 12V, they will charge up to 12V, according to the equation $1/2CV^2$...

I'm considering replacing the lead-acid starting batteries on my boat with something like this, a 500 F @ 16 V starting battery module. I understand the high-current risks associated with capacitors vs batteries. I had an older 12 V, 8 D battery explode on the boat. My guess is that it was off gassing due to age and condition and the gas ignited.
