Vanadium slag is a material rich in vanadium. Vanadium is reduced when producing pig iron to obtain molten iron containing about 0.25% V. Vanadium-containing iron is the main raw material for the production of vanadium dioxide, accounting for 50%-60% of vanadium produced globally.

The main drawbacks of this technology are the low specific energy, high self-discharge, relatively high toxicity of oxides of vanadium, membrane degradation caused by the highly oxidizing nature of vanadium in its V³⁺ state, and the high cost of the materials used in the electrodes and the membrane, which represent a high initial investment.
